

PROJECT 1: DIGITAL PRODUCT FUNNEL & CONVERSION OPTIMIZATION

Focus Area: Web & UX Analytics

Business Background

MartRhod records customer interactions throughout its online shopping journey, from website sessions and product views to cart additions, checkout events, and completed purchases. Understanding how customers progress through these stages is essential for improving the shopping experience and increasing sales.

Business Problem

Although customer activity is tracked across the purchasing journey, MartRhod lacks clear visibility into where users abandon the process before completing a purchase. This limits the company's ability to optimise the digital experience and recover lost revenue.

Project Goal

Analyse the digital customer journey to identify conversion bottlenecks, measure funnel performance, and recommend improvements that increase completed purchases.

Project Objectives

- Measure conversion rates at each stage of the purchase funnel.
- Identify where customers drop off before completing a purchase.
- Analyse product and regional conversion performance.
- Evaluate cart abandonment patterns.
- Recommend strategies to improve customer conversion.

Key Business Questions

- What percentage of users progress through each stage of the purchasing funnel?
- Where does the highest customer drop-off occur?
- Which products attract high interest but low conversions?
- How do conversion rates differ across regions?
- What factors contribute to cart abandonment?

Project Scope

This project focuses on customer interactions from website sessions to completed orders using internal behavioural and transactional data collected between January 2023 and December 2025.

DATASET SUMMARY

Purpose

This project analyses the digital purchasing journey using the subset of MartRhod's database related to customer browsing behaviour and purchase completion.

The selected tables capture user interactions from website sessions to completed orders, allowing the construction of an end-to-end conversion funnel.

Relevant Tables

Table	Role in Analysis
user_sessions	Starting point of every customer journey.
product_views	Measures customer interest in products.
add_to_cart_events	Indicates purchase intent.
checkout_events	Captures customer progression through checkout.
cart_abandonments	Identifies customers who leave before purchasing.
orders	Confirms successful conversions.
customers	Enables customer segmentation and regional analysis.
products	Provides product information for conversion analysis.
regions	Supports geographical comparison of conversion performance.
categories	Provides product category information for conversion analysis.
payments	Supports payment validation during checkout analysis.

Data Flow

The analysis follows the sequence below:

User Session → Product View → Add to Cart → Checkout → Order

Each stage is linked through customer, session, and product identifiers, making it possible to measure progression, conversion rates, and drop-off throughout the purchasing journey.

The complete table structures, column definitions, and relationships are documented in the **Master Data Dictionary** and **Master ERD**.
